Examiner's Amendment

1. An examiner's amendment to the record is attached. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

2. Authorization for this examiner's amendment was given in a telephone interview with Mr. Aaron C. Walker (Reg. 59,921) on August 23, 2010.

3. In the claims:

- Please amend the claims as attached

1. (currently amended) A method for operating a network that includes wireless data transmission between a plurality of users, the network having at least two radio cells which at least partly overlap, and each radio cell having at least one base station, each base station using at least one unique communication channel for transmitting data to one or more of the plurality of users, the method comprising:

interconnecting the base stations of the at least two radio cells, respectively, via at least one common communication channel;

at predefined maximum time intervals, the base stations in the respective radio cells simultaneously transmit test signals during test cycles, wherein, during each test cycle, each respective base station transmits a number of test signals at least equal to a number of unique communication channels being used by the respective base station and each base station having a radio cell that overlaps the radio cell of the respective base station;and

determining, within each respective radio-coupled user and based on the test signals, the unique communication channel with optimum transmission properties for that radio-coupled user;

transmitting by field devices measured values and control variables in an equidistant cycles to a programmable controller; and

inserting, by the programmable controller, a test cycle into each of the equidistant cycles, wherein

the communication link is a PROFIBUS communication link and wherein the programmable controller controls the base stations and the field devices connected to the programmable controller via the PROFIBUS communication link.

2. (original) A method as claimed in claim 1, wherein at least one user initiates the test cycles with messages recurring at the predefined maximum time intervals.

3. (original) A method as claimed in claim 2, wherein a user having a logic mastership in a network using an access procedure based on the master-slave principle is the user which initiates the test cycles.

4. (previously presented) A method as claimed in claim 1, further comprising:

sending, from each of the base stations, at least one test signal during a test cycle on the unique communication channel assigned to the respective base station;

setting, within each of the radio-coupled users, all the unique communication channels for reception of the test signals during the test cycle; and

retaining, within each respective radio-coupled user, a unique

communication channel with the best transmission properties for the transmission of data after the test cycle.

5. (previously presented) A method as claimed in claim 1, wherein each of the base stations successively
transmit the test signals on each of the unique communication channels during a test cycle so that no two base stations simultaneously transmit on the same unique communication channel.

6. (previously presented) A method as claimed in claim 5, further comprising:

receiving, within the radio-coupled users, the test signals during the test cycle on a unique communication channel that is fixed for the duration of the test cycle; and

determining which base station corresponds to the test signal on the unique communication channel received with the best transmission properties;

retaining, within each respective radio-coupled user, the respective unique communication channel of the determined base station as the one with the best transmission properties for the transmission of data after the test cycle.

7. (cancelled)

8. (currently amended) A communication system comprising:
a communication link operable to carry communication signals;
a plurality of base stations each corresponding to a respective cell and each connected to said communication link, each base station being operable to simultaneously transmit with other base stations test signals in each of a plurality of different channels during each test cycle;

a plurality of user devices each operable to receive the test signals in each channel from each base station, said user devices each comprising a channel determiner operable to determine a channel corresponding to a test signal with the strongest signal level and a switch device operable to switch an interface of the user device to the determined channel, wherein

each user device receives from each base station a number of test signals at least equal to a number of channels being used by the respective base station and each base station having a radio cell that overlaps a radio cell of the respective base station,

measured values and control variables are transmitted by field devices in an equidistant cycles to a programmable controller and the programmable controller inserts a test cycle into each of the equidistant cycles, and

the communication link is a PROFIBUS communication link and wherein the programmable controller controls the base stations and the field devices connected to the programmable controller via the PROFIBUS communication link.

9-17. (cancelled)
